Search Notes

Dear Examiner To,

Attached please find the results of your search request for application 09/832737. I searched Dialog's foreign patent files, technical databases, product announcement files and general files; along with the Internet.

Please let me know if you have any questions.

Regards,

Geoffrey St. Leger
4B30/308-7800

Voluntary Results Feedback Form

➤ I am an examiner in Workgroup: Example: 2133

➤ Relevant prior art **found**, search results used as follows:

- ☐ 102 rejection
- ☐ 103 rejection
- ☐ Cited as being of interest.
- ☐ Helped examiner better understand the invention.
- ☐ Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- ☐ Foreign Patent(s)
- ☐ Non-Patent Literature
(journal articles, conference proceedings, new product announcements etc.)

➤ Relevant prior art **not found**:

- ☐ Results verified the lack of relevant prior art (helped determine patentability).
- ☐ Results were not useful in determining patentability or understanding the invention.

Is this a "Fast & Focused" Search Request? (Circle One) YES NO

A "Fast & Focused" Search is completed in 2-3 hours (maximum). The search must be on a very specific topic and meet certain criteria. The criteria are posted in EIC2100 and on the EIC2100 NPL Web Page at <http://ptoweb/patents/stic/stic-tc2100.htm>.

What is the topic, novelty, motivation, utility, or other specific details defining the desired focus of this search? Please include the concepts, synonyms, keywords, acronyms, definitions, strategies, and anything else that helps to describe the topic. Please attach a copy of the abstract, background, brief summary, pertinent claims and any citations of relevant art you have found.

Languages: English

Document Type: Buyer and Vendor Guide

Grade (of Product Reviewed): A; C; B; B; C

Geographic Location: United States

Presents a buyer's guide to Web server security solutions that safeguard against unauthorized changes to the site. Shows a table comparing seven products from seven vendors on **detection of changes**, prevention of **changes**, prevention of exposure of **defaced** content, automatic delivery of good content after **hack**, and tools to restore **Web site** after **hack**. Products reviewed and their rating on a scale of 1 to 5 are: G-Server (\$25,000) from Gillian Technologies - 5; GFI LANguard System Integrity Monitor (\$0) from GFI Software USA - 3; McAfee Entercept (\$7,885) from Network Associates - 4; Secuve TOS (\$10,000) from Secuve - 4; Tripwire (\$7,590) from Tripwire - 3; WatchGuard Applock/Web (\$629) from WatchGuard Technologies - 4; WebAgain (\$995) from Lockstep Systems - 3. Reports that G-Server is ``Best Buy'' while McAfee Entercept merits ``Recommended.'' Includes a table, three photos, and three product summaries. (MEM)

The joke is on the vandals -- Lockstep's WebAgain 2.0 will notify you of hacks so you can sit back and relax

Rohan, Rebecca

InternetWeek , November 20, 2000 , n838 p48, 56, 2 Page(s)

ISSN: 0746-8121

Company Name: Lockstep Systems

URL: <http://www.lockstep.com>

Product Name: WebAgain

Languages: English

Document Type: Software Review

Grade (of Product Reviewed): B

Geographic Location: United States

Presents a favorable review of WebAgain (\$995), a security utility from Lockstep Systems of Scottsdale, AZ (877). Explains that it **detects** unauthorized **changes** to **Web sites** on a schedule that the administrator chooses and restores vandalized **Web pages** around the clock. Highlights its ease of use; remote functionality; ease of installation; and notification of changes via Simple Mail Transfer Protocol (SMTP) mail, as an entry in the NT Event Log on any computer in the network, or via a Simple Network Management Protocol (SNMP) Trap of what it found and repaired. Mentions, however, that in order to see properties for

files in the archive, the user must click on only one file and look at a bar below the file list. Concludes that it represents a smart way to protect corporate investments in the **Web site** and the organizational image. Includes two sidebars, two screen displays, and a product summary.

Jolted Over Electronic Voting; Report's Security Warning Shakes Some States' Trust
Schulte, Brigid
Washington Post, p A.01
Aug 11, 2003
ISSN: 0190-8286 NEWSPAPER CODE: TWP
DOCUMENT TYPE: News; Newspaper article
LANGUAGE: English RECORD TYPE: ABSTRACT

ABSTRACT: Maryland officials, who signed a \$55.6 million agreement with Diebold for 11,000 touch-screen voting machines just days before the Hopkins report came out, have asked an international computer security firm to review the system's security. If they don't like what they find, officials have said, the sale will be off. [Avi Rubin] analyzed portions of Diebold software source code that was mistakenly left on a public **Internet site** and concluded that a teenager could manufacture "smart" cards and vote several times. Further, he said, insiders could program the machine to **alter** election results without **detection**. All machines had the same password hard-wired into the code. And in some instances, it was set at 1111, a number laughably easy to **hack**, Rubin said. That doesn't satisfy some critics. "The most important thing about the Hopkins report is not the security holes they found, but irrefutable proof that all this stuff that the machines are secure is hot air," said David Dill, a computer scientist at Stanford University who has turned the debate over electronic

machines into a national crusade.

DOCUMENT TYPE: Commentary; Newspaper article
LANGUAGE: English RECORD TYPE: ABSTRACT

ABSTRACT: A piece in the most recent Harvard Business Review by Robert Goffee and Gareth Jones puts forward the theory that managers ought to decide upon a character flaw to display when in the office. This, they say, has two advantages: it makes the boss seem more human and thus more approachable (true - WPM has always found jolly nice people ever so difficult to talk to); and it also serves the purpose of masking even more unsavoury character traits (a hint: it doesn't. We know them all). WPM can only wonder how bosses decide on the one fault they are prepared to reveal. "Shall I assemble all the paperclips in the office into a long chain? Hm, might not mask the fact that I'm a crashing bore. Set my computer to ping loudly when email arrives? No, need to be more human. Empty the photocopier of paper? A **spot** of **vandalism** in the staff toilets?" *There's no advice on how to deal with a pub rock-loving colleague on www.secretary1.com, but there is plenty of stuff about improving your shorthand, finding companies to make conference badges and hiring a massage therapist to come to your office, and so it is **website** of the week. Although WPM, whose desk is currently carpeted in sticky memo notes of every hue, is disconcerted to learn from the site that this method of information gathering could give the impression that WPM is disorganised .

Computer Company Warns of 'Attack' Software
Bridis, Ted
Wall Street Journal, p B2
Jun 9, 2000
ISSN: 0099-9660 NEWSPAPER CODE: WSJ
; Newspaper article
LANGUAGE: English RECORD TYPE: ABSTRACT

ABSTRACT: The greatest threat is posed to e-commerce **Web sites**, which could be disrupted if "zombie" computers with the attack software were instructed to overwhelm those sites with floods of spurious data, called a "distributed denial of service" attack. The same technique, on an enormous scale, was used in February to bring down some of the Internet's marquee sites, including Yahoo!, CNN and eBay. But in those cases, **hackers** broke into corporate and academic computers to implant the attack software rather than tricking victims into implanting it themselves. The program appears to be a video file in the so-called avi format, but actually carries an "exe" extension, signifying that it will execute commands on the computer. The name of the infected file **changes** randomly to avoid easy **detection**, but typically includes nonsensical letters, such as "WUYILLKM."

**MAKER OF CYBER PATROL SETTLES WITH HACKERS WHO SPILLED SECRETS BUT ACLU
ARGUES DEAL CAN'T BAR OTHERS**

Bray, Hiawatha
Boston Globe, p E6
Mar 28, 2000
ISSN: 0743-1791 NEWSPAPER CODE: BG
DOCUMENT TYPE: ECO; Newspaper article
LANGUAGE: English RECORD TYPE: ABSTRACT

ABSTRACT: The controversy began when Eddy Jansson of Sweden and Matthew Skala of Canada deciphered the code that makes Cyber Patrol work. They then wrote a program called CPHack, which enables the user to read a complete list of all **Internet sites** blocked by Cyber Patrol. CPHack also reveals the **master** password for Cyber Patrol, so that a user can simply **switch** off the program, which filters out pornography and other objectionable material. Microsystems went to court, charging that Jansson and Skala had violated their copyright by creating and distributing CPHack. Last week, a federal judge in Boston, Edward Harrington, issued a temporary injunction against Jansson and Skala and their Internet service providers. The four defendants were ordered to stop posting CPHack on the Internet. They quickly complied.

Viruses And Their Cures
Lewis, Peter H
New York Times, p 1
Dec 16, 1999
ISSN: 0362-4331 NEWSPAPER CODE: NY
DOCUMENT TYPE: Commentary; Newspaper article
LANGUAGE: English RECORD TYPE: ABSTRACT

ABSTRACT: Kathy Fithen, manager of the Computer Emergency Response Team at Carnegie Mellon University, a project that receives part of its financing from the Department of Defense, said: "We are anticipating a lot of date-triggered viruses because of Jan. 1. This is really a time to be diligent" in following standard antivirus procedures, Ms. Fithen said, "but it's not a time for panic." The team maintains a computer security **Web page** at www.cert.org/y2k-info. Several of the newer threats, including viruses called Prilissa and Mypics, are scheduled to do their nastiest work in coming weeks, in Prilissa's case when someone opens an infected e-mail attachment on Christmas Day, and when Mypics **detects** the computer's clock **changing** to 2000. Other viruses are expected to emerge in coming weeks as their twisted creators try to capitalize on Y2K-related confusion. Some of these viruses can reformat your hard disk drive, permanently erasing all the files on it. Some can mail themselves to your friends and associates by commandeering your e-mail address book. There is even one that can alter your system and notify the **hacker** via e-mail when your computer is vulnerable to further attacks.

This product provides security for a user's **web site** by automatically and without attendance, monitoring the site. It automatically and without attendance restores a **hacked web site** and notifies the **web site** administrator. It also retains **hacked** version copies. It automatically, and without personal attendance, **restores a web site**, that has been tampered with, to its **original** condition, and automatically notifies the **web site** administrator via e-mail or alphanumeric paging of the restoration status. The user specifies the **web site** and the frequency of unattended monitoring. It uses Cyber Vista's Data Grabber technology to automatically, and without personal attendance, monitor the specified **web site** for unauthorized changes such as **hacked** graphic images, **hacked** text, etc. It automatically retains a copy of the **hacked** version of the **web site**.

The Techmonth **website** of Singapore's National Science and Technology Board (NSTB) has been **hacked** into, allegedly by a group of five **hackers** who call themselves KKND, ph4nt4, raver, calvim and nessus. The site's **main webpage** has been **replaced** with another **webpage** with the words "Talita, te amo! muito", which means "Talita, I love you! very much!" in Portugese. NSTB held Techmonth 2000 in September 2000 to promote local technopreneurship.

PC-cillin (TM) Internet Security, offered by Trend Micro (TM), allows users to protect computers, networks, and PDAs from viruses, **hackers**, and spam messages. The system includes firewall, virus **detection** and **removal**, URL filtering, parental control, and spyware deletion features. Its Damage Cleanup Services are triggered when viruses are identified. PC-cillin Internet Security automatically prevents infected computers from accessing networks, limiting the spread of viruses. The product includes wireless device protection features. It also prevents unauthorized users from monitoring Internet activity. The system also supports the creation of multiple security profiles. An evaluation version of PC-cillin Internet Security can be downloaded from the Trend Micro **Web site**.

Lockstep Systems offers WebAgain (TM) 2.1.2, a **Web site** protection utility. Site managers can use WebAgain to ensure that they are notified of any changes to their sites and that the **original** content is **restored** easily if an intruder makes unauthorized additions or changes. Without a solution such as WebAgain, **hackers** can vandalize site pages with false prices and information, graffiti, and other misinformation. The system scans sites for evidence of **hacking**, then sends e-mail notices to administrators when an es. WebAgain 2.1.2 also makes it easy to store various revisions of site con ; and to harvest **Web site** files. Site managers can protect several sites wit ndows (R), Linux, or UNIX site, whether in-house or hosted. The system creates a **Web site**-specific rescue kit that makes it easy to restore an entire **Web site** from a content archive.

GRADE: A

Lockstep Systems' WebAgain 2.5, a Web content management intermediate server, gets excellent marks overall, especially for its ability to ensure that content is staged and saved before deployment on a **Web site**. The staging server queries the **Web site** at user-configurable intervals to determine if files have differences. If files are found to unsynchronized, contents and files are captured and isolated on the Lockstep server, and the **original** content is **restored**. The software adds an entry in a log and sends the administrator a message. Many other product provide similar features, including Tripwire for **Web Pages** and WatchGuard AppLock, but only WebAgain can claim self-healing abilities through content restoration without manual intervention. WebAgain 2.5 guards against concerted **hacker** attacks and is an excellent tool for eliminating the danger of accidental content corruption. WebAgain 2.5 also provides a useful audit trail for all modifications made to a **Web site**. If the user decides to deploy WebAgain 2.5, the only change to workflow is that content is published to the WebAgain server instead of directly to a Web server. New features in WebAgain 2.5 include better security through support for virtual private network (VPN) tunnels and virtual directories, faster performance, a Japanese version, and support for Microsoft Windows XP.

Geoff Teekema, CIO for e-Travel, discusses his decision to outsource some operations to a managed security services provider (MSSP). Teekema says the vendor hired, TruSecure, did a full-scale analysis of the **Web site** and e-Travel's data center, using security scanners to determine what type of malicious behavior a rogue employee or **hacker** could cause should they get in back of the company's firewall. All security policies and procedures were also analyzed to find out how e-Travel was monitoring its site, how it responded to possible **hack** attempts, and how it verified that no one tried to illegally gain access to data. After the security audit, Teekema made some **changes**, including installation of intrusion **detection** software and tightening of security procedures. e-Travel also gives TruSecure an image of its infrastructure, as well as a full list of software and hardware applications, and TruSecure monitors all software patch releases, alerting Teekema when a new patch must be installed. If e-Travel decides not to install a patch because of application incompatibility, for instance, IT managers must document the reason. Those security openings are then specifically addressed in the next security audit to make sure the missing patch has not created a vulnerability.

Such companies as Sony, Honda, and NEC are pushing the consumer robotics market. Sony's robotic canine, AIBO ERS-210, uses a number of sensors, including a 100k pixel SMOS color camera, to interact with environments. AIBO ERS-210 develops complex behaviors, responding to stimulation, or the lack of it. Sony has not been forthcoming about the AIBO ERS-210's technology, and a **hacker** cult, represented at such **Web sites** as www.AIBOhack.com, has sprung up around the robot. One **Web site** features flowcharts tracking W01 AIBOLife software evolution. Another examines the ROM Demo AIBO and W02 Hello AIBO behavior and personality applications. **Hacking** aside, the AIBO Master Studio (AMS) application lets users edit AIBO's motions, lights, and sounds. Several actions can be combined using the application's Behavior Arranger feature. Other companies are marketing robots to consumers. Honda's ASIMO is a humanoid robot that stands four feet tall and weighs 100 pounds. It can navigate through rooms and climb stairs. Plug-ins will expand its behavior in the future. NEC's R100 taps PC-based **editing** software and offers directional hearing, **recognizing** and responding to voices and commands. Prices for consumer robots should plummet within the next five years.

Tripwire's Tripwire for Web Pages 1.0, an Apache Web server module that 'scans your Web site's files and automatically detects whether an intruder has defaced or modified those files,' gets excellent marks for affordability; scalability; ease of use; ease of installation and administration; customizable intrusion response; and protection of static and dynamic Web pages. TripWire for Web Pages 1.0 is compatible only with the Apache Web server and transparently automates protection of Web sites running the Apache Web server. TripWire 1.0 operates by creating an MD5 hash of the World Wide Web site files to be protected. When the Apache server sends a response to a HTTP 'get' request (which grabs content from URLs), the server checks the hash of the file being served against the has stored in the TripWire database looking for a match. If the hashes do not match, the server does not serve the page and launches the customizable intrusion response mechanism. TripWire can be altered to conduct specific actions when it sees a modification. Testers found installation very straightforward, and that TripWire also assists in protecting sites that use dynamic Web pages by ensuring the integrity of Java class files and Perl scripts.

BlueSpike's Giovanni, Digimarc's Digimarc ImageBridge, Alphatec's EIKONAmark, Signum Technologies' SureSign, MediaSec Technologies' SysCoP, and RedSoft's Batch It! are digital watermarking and World Wide Web spider products that can protect online images from unauthorized use. Digital watermarks embed images with marks that cannot be seen by the human eye. The marks are only visible with special viewing components, but some can be found by Web-searching software. ImageBridge automatically routes viewers and possible copyright infringers directly to the image owner's **Web site**, where the pictures can be purchased legally. EIKONAmark has some of the same types of features, including the AlphaCrawler Web search utility. EIKONAmark can also scan and **detect alterations** made to image and highlights **changed** areas in red. BlueSpike makes Giovanni software, which it now markets to the record industry (in which it wants to be the dominant watermarking-standard provider). However, Giovanni watermarks can also be embedded in image files with marks as tiny as 100/100 pixels. Giovanni is not fazed by JPEG compression or **hackers** attempting to erase or destroy a watermark. SureSign is a plug-in for Photoshop that embeds a watermark, and SysCoP is a Web spider. Shareware programs available are Fluid Vision Systems' Tranz Image Watermarking System for JPEG images and BatchIt! for JPEG, BMP, PCX, PNG, GIF, and TIFF formats.

ISSN: 0746-8121
HOMEPAGE: <http://www.internetwk.com>

RECORD TYPE: Review
REVIEW TYPE: Review
GRADE: A

Lockstep Systems' WebAgain 2.0 gets excellent marks for features that **detect alterations** to **Web sites**, running on a user-set schedule and restores damaged **Web pages** around the clock. The user's presence or hands-on actions are not required since WebAgain alerts users to **hacks** by Simple Mail Transfer Protocol (SMTP) mail, either as an entry in the NT Event Log on any networked computer or through a Simple Network Management Protocol (SNMP) trap of what was found and fixed. Users can view details by launching WebAgain's administrator interface from any Windows 98 or higher computer on the same network to which the NT/2000 machine that runs the WebAgain service is connected. Testers quickly installed Web Again, which runs in the background, and then installed a user-friendly administration interface. The administration interface has a side bar of four icons (Status, Archive, Quarantine, and Message Log), from which users can view different types of information in the main viewing area. WebAgain 2.0 works on local or remote **Web sites** as well those that are hosted. Single sites or mirrors are served. WebAgain 2.0's easy-to-use tools **detect** even the tiniest **changes** to **Web sites**. No site can be protected from every attack, so WebAgain 2.0's ability to alert users to

hacks and inadvertent file corruption offers a very savvy way to protect a site and the image of an organization.

REVIEW TYPE: Product Analysis

GRADE: Product Analysis, No Rating

Users who wonder if the Linux open source operating system (OS) is as invulnerable to security breaches as UNIX can find out how to configure Linux to fend off destructive attacks. Among resources are the **Web sites** of Linux vendors and of the CERT Coordination Center, Linux Online, Planet IT Security Tech Center, and Sendmail Consortium. To make the most of Linux, users should regard the open-source model as a flexible OS with security advantages that become possible through the type of 'hardening' done on UNIX systems. For instance, UNIX can be made just about invulnerable when small applications are coded in a single function architecture and are linked via scripting. Source code is openly available, which means that security experts can get an application or OS' source code and alter it to meet their own needs and to provide iron-clad security. Network administrators can also take measures to secure a general purpose Linux server without closely examining source code. Samba is a good choice, since it allows Linux to imitate the file and print services of Windows NT and similar services, as well as domain name services. Samba communicates with NT and can **replace** an NT **primary** controller so that the administrator can eliminate many security loopholes in a combined Linux-NT installation. DNS services running on Linux improve performance but make large amounts of data available to **hackers** who gain entry to the DNS server. To begin securing a Linux installation, users can restrict access to the BIND server and provide information only to certain specified users.

Gilian Technologies Ships the G-Server; First Web Content Security Solution with ExitControl; New Network Appliance 'Mitigates Hack Attacks' - Product Announcement

Edge: [Work-Group Computing Report](#), [May 1, 2000](#)

[New!] Save a personal copy of this article and quickly find it again with Furl.net. **Get started now.** (It's free.)

Webmasters and site security officers may sleep better tonight, thanks to the introduction and release of the G-Server, the first Web content security and integrity system with new ExitControl technology. Developed and marketed by Gilian Technologies Inc., a Silicon Valley-based Internet infrastructure company (with credentials in Israeli cryptography and military communications security), the G-Server prevents accidental or intentional damage to Website data by transparently intercepting and replacing corrupt, altered or defaced content before it is released to the public.

The announcement was made at the Internet Security Conference Tuesday in San Jose, Calif., where the product is being shown in booth number 156-157.

"You cannot stop site penetrations by persons unknown. However, you can be certain that a defacement is never seen by the customer," Rafael Feitelberg, Redwood City-

based CEO of the two-year-old Web infrastructure company. "Last year, more than 5,000 Websites were seriously compromised. Security archives demonstrate these attacks are on the rise reaching more than 1,000 such incursions per month. These damaged sites had traditional security technology installed. The G-Server could have saved them."

In recent months, major defacements have occurred on the Websites of The New York Times, Symantec, Lloyd's of London, Yahoo, NASDAQ, Wired, ABC-TV, MSN and even venerated security companies, among thousands of others.

"No one is totally immune from the malicious intentions of obsessed hackers, and Web managers have typically had few tools in their arsenals with which to mitigate hack attacks," said Joshua Greenbaum, a principal with Enterprise Applications Consulting, an industry research firm based in Berkeley, Calif. "Gilian's new ExitControl technology can change the balance of power by enabling Web sites to guarantee that the content they publish from their sites is as hacker-proof as possible."

The G-Server is designed to offer content-rich sites high reliability and assurances that the data they publish is genuine. This is especially important to publishers whose Web content is their fundamental business.

"Websites' legal liability is increasing as users rely on published content for trading and other business purposes," Greenbaum added. "E-Commerce, news media, financial and equity trading sites can't afford to publish incorrect or altered data. It could put them out of business."

A beta user at a major Northeastern U.S. newspaper (who declined to be identified by name due to security policies) reported the G-Server not only maintains content integrity but enables them to more effectively manage the staging and production processes. "Before we had a mixed bag of methods to post new content, now with G-Server, the process has become streamlined and efficient." The Next Step in Content Assurance

Unlike traditional security devices -- such as firewalls and access controls -- the G-Server won't impede hostile penetrations but instead acts to ensure only genuine, authorized content is ever published by a Website. Gilian has developed proprietary, high-performance, patent-pending ExitControl technology. ExitControl is like a guard standing at the exit of a store checking each shopper's receipts where the G-Server compares all requested data with a digital signature unique to that data. If the requested content fails the test, the G-server replaces the corrupt data with a genuine copy and then dispatches the copy to the user.

"Our testing of the G-Server indicates the product lives up to its billing," said Jeff Mace, president of MaceLabs Corp., an independent product testing company. "The detection of altered content works well and the recovery mechanisms run as specified. Functionally speaking, the G-Server is stable and robust, especially for first generation product. The G-Server's unique technology of dealing with unwanted intruders will easily make this product a winner, if not a necessity, for any mission critical corporate site." Network Transparency and Digital Signing

The G-Server is a systems-level solution that resides on a network between the Internet and a Web server. Because it use no IP address -- the numerical method by which Internet systems identify each other (much like telephone numbers) -- it is literally invisible as a network device and makes it extremely secure.

As new content and material is created for the site, the high-performance G-Server creates algorithmically coded digital signatures of the content thus making any alteration) forgery or defacement easy to detect and correct. Any change in content will break the digital signature. When a Web object is requested, an integrity check is made by the G-Server against the digital signature on file. Genuine content will be allowed to pass without any noticeable delay. If the content fails muster, the replacement content is instantly delivered. At the same time, the G-server sends an event alert to the appropriate contact by e-mail, pager or telephone noting where the problem resides.

Installation, Pricing and Availability

G-Server comes as an appliance pre-installed and tested on a Pentium III-class network server and pre-configured to the host network where it will be installed. Installation is plug-and-use and often takes less than an hour to install and test. Pricing for the G-Server in its primary configuration begins at \$54,000 and is available immediately.

Gilian Technologies Inc. is a Silicon Valley-based Internet infrastructure company with credentials in Israeli cryptography and military communications security. It is the global technology leader in exit control security and content integrity systems for commercial Websites. Based upon patent-pending ExitControl technology, Gilian's G-Server solution ensures that all Web content published is both authentic and authorized, thus preventing any defacement damage while maintaining high availability. The company is headquartered in Redwood City, Calif. and has offices in Boston, Mass. and in Israel. Gilian Technologies is located on the Web at: www.gilian.com.

NEW WEBAGAIN™ SOLVES WEB SITE VANDALISM

Phoenix, Arizona USA, June 12, 2000 - - Lockstep Systems, Inc. today announced the release of WebAgain™ version 1.0. We patent-pending Windows utility that automatically fixes vandalized Web sites. It is available immediately and priced at \$499

WebAgain is designed to solve the problems associated with web site defacement by automating content verification, alteration and the correction process. It can detect any type of alteration, whether obvious or subtle, and correct it without any need for involvement. WebAgain provides round-the-clock web site defacement protection by systematically comparing an organization's web site data to an archive maintained at the WebAgain Server. WebAgain detects any differences between the public site and an archive; immediately re-publishing the appropriate files and restoring the web site to its original form.

The defacement of an organization's web site exposes visitors to misleading information until the unauthorized change is discovered and corrected. As the site grows in size, it becomes more difficult and time consuming to manually verify each page for accuracy and completeness. Web site hacks may be present and left unidentified for some time before they are discovered because it becomes impossible to continually check the integrity of each page. By automating the web site verification, alteration discovery and correction process, WebAgain minimizes the time that web site visitors would be exposed to misleading information.

"Internet presence companies rely heavily on their web sites, but these sites are very vulnerable. Anyone with Internet access can potentially alter a web site, to post misleading information or to redirect sales traffic," said Karl Forster, Lockstep's President. WebAgain proactively ensures the integrity of a web site and gives Internet presence companies a tool which automatically corrects any unauthorized changes. WebAgain defeats the goal of the hacker by quickly republishing the altered web pages."

WebAgain complements the methods and tools companies use to publish their web sites. It accepts web content from all web software programs, such as Microsoft Front Page and Adobe's GoLive and PageMill. Web authors publish their files to the WebAgain Server where it archives the web content and publishes the pages to the company's public web sites and any associated mirrors. WebAgain guarantees delivery of the content to each desired target web site by queuing the content and routinely attempting to deliver this information to all sites until each has successfully received the data.

Highlights of WebAgain version 1.0 include the ability to:

- o Automatically detect defacement and unauthorized web site changes.
- o Quickly restore defaced web pages and return web site to original form.
- o Receive web pages from any web authoring software program.
- o Simultaneously publish to multiple sites and guarantee delivery.
- o Archive web site content and store multiple revisions.
- o Publish a web site back to "any-point-in-time."
- o Send notices via e-mail, SNMP traps, or NT Event Log messages, when changes are detected and corrected.
- o Quarantine defaced and changed web pages for off-line inspection.
- o Protect multiple web sites and their mirrors using a single WebAgain Server.

WebAgain can protect web sites hosted by a company internally or at an Internet Service Provider (ISP). To protect a web site requires access to the site through a network or dial-up connection. WebAgain runs as a Windows NT / Windows 2000 Service round-the-clock protection. The WebAgain Server software contains a built-in fault tolerant feature allowing the software to remain in operation in the event of power loss or machine reboot. The WebAgain Server may be remotely administered using WebAgain Administrator software. A single installation of WebAgain can protect multiple web sites with the licensing of a multi-web-site key.

WebAgain System Requirements: WebAgain Server software runs as a Windows NT/2000 Service on an IBM PC/Compatible Windows NT 4.0 or Windows 2000; requires 5MB of hard disk space (not including extra storage to hold Web site archives); MB RAM; Microsoft Internet Explorer 4.0 or Netscape Navigator/Communicator 4.0. The WebAgain Remote Administrator req Windows 95, 98, NT 4.0 or Windows 2000; Microsoft Internet Explorer 4.0 or Netscape Navigator/Communicator 4.0.

WebAgain is available direct from Lockstep Systems, Inc. and is priced at \$499.00 US for a single license to protect one web associated mirrors. A 30-day, full-featured trial version may be downloaded from Lockstep's web site: <http://www.lockstep.com> pricing available upon request; inquiries welcome.

Lockstep Systems, Inc., a privately held corporation, was founded in 1998 to develop and market e-continuity software utilit to ensure the integrity and continuity of electronic data for Internet presence companies. Lockstep Systems, Inc., P.O. Box Scottsdale, Arizona (AZ) 85252-1906 USA. Telephone +1.480.596.9432. Fax +1.480.596.9195. Toll-free (in USA) 1.877.WE (877.932.3497). Web site URL: <http://www.lockstep.com>. Questions and comments are welcome via e-mail addressed to info@lockstep.com.

Note to Editors: Lockstep Systems and WebAgain are trademarks of Lockstep Systems, Inc. All other products mentioned are and/or registered trademarks of their respective manufacturers.

DOCUMENT-IDENTIFIER: US 5983277 A

TITLE: Work group computing for electronic design automation

----- KWIC -----

Detailed Description Text - DETX (50):

Before entering into a discussion of possible file states from a local user's point of view, embodiments of version control (or revisions) will be discussed. Version control allows a user to preserve and restore previous versions of files which have been modified. In a single-user environment, this is useful to facilitate "backtracking" which is when the user wishes to "undo" a series of significant changes to a file. It is also useful to prevent accidental data loss. In a multi-user setting, it is useful for arbitrating access to shared files, so that two users may not accidentally edit the same file simultaneously.

US-PAT-NO: 6405219

DOCUMENT-IDENTIFIER: US 6405219 B2

****See image for Certificate of Correction****

TITLE: Method and system for automatically updating the version
of a set of files stored on content servers

----- KWIC -----

Detailed Description Text - DETX (39):

The logic steps to a block 172 where the Primary and Secondary global servers generate a content update container that includes a previous version of the set of source files for each local content server. The Primary and Secondary global servers copy the previous version of modified source files and restore removed source files from the previous version to at least one sub-directory on the local content servers. The logic flows to a block 174 where the Primary and Secondary global servers cause the version of the set of source files on each local content server to roll back by renaming the previous version of the set of source files included in the content update container copied to the a sub-directory on each local content server. Also, any version of the source files that are newer than the previous version are deleted at this time. Next, the logic advances to an end block and terminates.

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
CA 2429503	A1	E	10	G06F-012/14	

Abstract (Basic): CA 2429503 A1

NOVELTY - The web pages to be protected are saved as samples.
Specific portions of pages that are not checked, and time interval
during which checking is not performed, are selected. The portions of
pages other than selected portions are compared with samples in the
interval other than selected interval to evaluate changes in pages to
detect hacking. Changes are indicated to page owner to restore
original page status.

USE - For protecting web pages from corruption that occurs due
to hardware error, software bug, hacker and virus.

ADVANTAGE - Evaluates the changes in the web pages
automatically and easily, thereby preventing program/data with virus
pattern from being inserted into the web pages

World wide web page protection method involves detecting hacking
traces and illegitimacy in web pages, after which original status
of web pages is restored

Patent Assignee: HEJL P (HEJL-I)

Inventor: HEJL P

Number of Countries: 001 Number of Patents: 001

Patent Family:

Patent No	Kind	Date	Applicat No	Kind	Date	Week
US 20030221129	A1	20031127	US 2003445229	A	20030527	200403 B

Priority Applications (No Type Date): US 2003445229 A 20030527

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
US 20030221129	A1		4	G06F-012/14	

Abstract (Basic): US 20030221129 A1

NOVELTY - The world wide web (WWW) pages to-be-protected are stored as a sample. A non-compared portion of **web pages** is selected and corresponding time interval is defined. The **web pages** other than selected portions, are compared with sample outside defined interval, so as to detect **hacking** traces and illegitimacy in **web pages**. The detection result is notified to a page owner and **original** status of **web pages** is **restored**.

USE - For protecting world wide web (WWW) pages from hardware error, software bug, **hacker** and virus.

ADVANTAGE - Enables for accurate differentiation between legitimate and illegitimate changes with respect to WWW pages, automatically.

DESCRIPTION OF DRAWING(S) - The figure shows a flow diagram explaining the WWW page protection method.

Abstract (Basic): US 20030145197 A1

NOVELTY - Web resources illegitimate **change detecting** apparatus comprises a web source protection processing sub-system, for generating and inserting illegitimate **change detecting** information into corresponding web resource; and a web resource **change detecting** sub-system for judging whether or not the corresponding web resource is illegitimately **changed**, based on the illegitimate **change detecting** information.

DETAILED DESCRIPTION - Web resources illegitimate **change detecting** apparatus comprises a web source protection processing sub-system, for generating and inserting illegitimate **change detecting** information into corresponding web resource, the illegitimate **change detecting** information being used to **detect** whether or not the web resource is **changed** illegitimately; and a web resource **change detecting** sub-system for judging whether or not the corresponding web resource is illegitimately **changed**, based on the illegitimate **change detecting** information contained in the web resource, when the web resource is executed by a communication network.

An INDEPENDENT CLAIM is also included for a computer-readable recording medium containing computer-executable instructions, for performing the **detection** of an illegitimate **change** of web resources.

USE - Web resources illegitimate **change detecting** apparatus, useful in e.g. electronic commerce services and on-line stock services.

ADVANTAGE - The illegitimate **change detecting** information is verified in real time when the corresponding **web page** is inquired, **detecting** the illegitimate **change** of the **web page**. The user can confirm the illegitimate change of the **web page**, by clicking the link to the illegitimate **change detecting** information only when necessary, obtaining an effective processing. Problems such as the manipulation of the goods price and the stock price caused by the **hacking** of the web server can be prevented.

DESCRIPTION OF DRAWING(S) - The figure is a schematic block diagram of a web resource protection processing sub-system.

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
US 20020040432	A1		14	H04L-009/00	
JP 2002175010	A		10	G09C-001/00	

Abstract (Basic): US 20020040432 A1

NOVELTY - A web server in public-web-server computer checks whether the encrypted safe-web-file is illegally altered, upon receiving a user's request, and sends deciphered web-file back to user. A recovery unit encrypts web-file to safe-web-file on original-web-server computer. The public web server automatically recovers the altered safe-web-file, when the illegally altered file is checked.

USE - For prohibiting illegal alteration of homepages.

ADVANTAGE - The web file containing the altered data can be **automatically replaced** with the **original** web file, on **detection** of file **alteration**, hence the homepage can be automatically reinstated and the transmission of illegally changed data to user is prevented. The alteration prevention system can be installed without any change in current system. The financial impact is not obtained, since no special machine or technology is needed and the currently used browser application and tools can be used without burden, hence there is no impact on Internet users.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of

anti-alteration system.

CA 2387324	A1	E	9	G06F-012/14	

Abstract (Basic): CA 2387324 A1

NOVELTY - A set of protected sample world wide web (WWW) pages are stored through a browser. The currently displayed WWW pages are compared with the stored pages, at defined time intervals. If the content in the compared pages are different, **hacking** traces are searched in currently displayed pages and are changed, to **restore** the **original** status of the pages under display.

USE - For detecting and correcting corruption of static and dynamic WWW pages, due to hardware error, **hacker**, software bug and virus.

ADVANTAGE - The **original** status of the WWW pages can be **restored** efficiently, in an automated or semi-automated manner. The method is inexpensive and efficient. The WWW pages can be stored through browsers without requiring a need to access the servers.

Abstract (Basic): US 20030115486 A1

NOVELTY - A packet is collected on a network and an original rule that is most similar to the collected packet is searched from a rule database (30) in which a rule for intrusion **detection** is stored. The **changed** position of the collected packet is estimated from the original rule so as to determine whether a **hacker** intrudes.

USE - For detecting intrusion of **hacker** on computer network by using adaptive rule estimation in network-based intrusion detection system (NIDS).

ADVANTAGE - Enables preventing the indirect attack of the **hacker** using packet whose number of bits is changed due to deletion/insertion of characters from/into the packet.

DESCRIPTION OF DRAWING(S) - The figure shows a flowchart illustrating the intrusion detection method by adaptive rule estimation in NIDS.

KR 2003035143	A		1	G06F-015/00	

Abstract (Basic): KR 2003035143 A

NOVELTY - A unified security management system is provided to normalize event logs, generated by various **hacking** detection systems, into mapping event logs by using a mapping table reclassified according to a detection type and a risk degree.

DETAILED DESCRIPTION - The system comprises an agent(10), a manager(20), and a user interface. The agent(10) includes a collector, a storage, and a controller. The collector collects event logs from **hacking** detection systems. The storage stores a mapping table reclassified according to a **hacking** detection type and a risk degree. The controller normalizes the collected event logs into mapping event logs by comparing the collected event logs with the mapping table. The manager receives the normalized mapping event logs, analyzes them, generates corresponding messages according to an analysis result, and transmits the corresponding messages to a console. The user interface analyzes the corresponding messages transmitted from the manager(20), outputs the analyzed corresponding message, and adds or **modifies** the

hacking detection types. If the mapping event log has a low risk, the manager outputs a simple event message as the corresponding message, but if the mapping event log has a high risk, the manager outputs an alarm event message as the corresponding message.

Patent Details:

Abstract (Basic): KR 2002044452 A

NOVELTY - A data shield is provided to build a stable computer environment, to save time and cost, and to stably apply a computer system by restraining the change or deletion of the folders and the data in a computer.

DETAILED DESCRIPTION - A data shield is developed by using a C++ program language. Upon installing a program, the folder composition, the file structure and composition and the user environment set-up of a user PC(Personal Computer) are memorized. The user PC environment is compared to a first set-up environment in real time. If a wrong operation, **hacking** or virus infection is sensed, the first set-up environment is restored. The files and folders are restrained from a random movement, deletion and change. If a program undesired by a manager is **sensed**, the program is **removed** immediately.

Patent Details:

Patent No Kind Lan Pg Main IPC Filing Notes

GB 2372347 A 39 G06F-001/00

Abstract (Basic): GB 2372347 A

NOVELTY - Headless computer entity is provided with a license key data stored on a raw disk sector separate from a system disk and a data disk. The license key data is used to control the available data storage capacity within the headless computer entity, and protect the computer entity from unauthorized upgrade to a higher product specification. The license key data is encrypted and protected from **hacking** via software updates introduced on an external data carrier such as CD ROM.

DETAILED DESCRIPTION - INDEPENDENT CLAIM included for the following:

- (a) physical data storage device;
- (b) method of operating a computer entity;
- (c) method of generating a computer entity

USE - For headless computer entities.

ADVANTAGE - The license key data may ensure that users cannot add a pre-formatted extra disk to a computer entity, and thereby gain extra data storage capacity, without reference back to the manufacturer. The license key data ensures that after a physical disk **replacement**, a headless computer entity is still restricted to use an **original** number and capacity of logical disk, so if a user **replaces** a physical

disk with a larger capacity physical disk, then only the original authorized data capacity specified by the license key data will be used on the replacement physical disk. This has the added benefit that computer entity tape back-ups will be compatible with any past and future computer entities, regardless of the size of the physical hardware disk, since the actual logical data partition stored on the back-up tape will always be the same size.

DESCRIPTION OF DRAWING(S) - The diagram shows a license key data stored in a raw disk area of a data storage device of the headless computer entity.

Abstract (Basic): EP 402210 A

In order to verify the integrity of a data message or logic signal, and algorithm (A) is applied to at least part of the original message and a signature (S1, S2, ..Sm) is calculated and memorised. The equipment also includes the processing circuits (11) capable of applying the algorithm.

In order to verify the integrity of the message at the point of use, the algorithm is again applied, and the signature determined. This is then compared with that determined from the original message.

USE - The system allows checking of a program in order to ensure that no accidental or deliberate alteration of the program has occurred. (19pp Dwg.No.3/6)

**Seiko Instruments Signs Joint Development Pact With CYBER VISTA, Silicon
Valley Software Developer; Firms to Build Specific Application "Agents"
For Use In Future SIU Products.**

Business Wire, p9300050

Sep 30, 1997

LANGUAGE: English RECORD TYPE: Fulltext

WORD COUNT: 532 LINE COUNT: 00053

TEXT:

SAN JOSE, Calif.--(BUSINESS WIRE)--Sept. 30, 1997--Seiko Instruments USA Inc. (SIU), a leading provider of innovative products designed to solve business and home/office problems and enhance productivity, Tuesday announced a joint development agreement with CYBER VISTA, a growing supplier of intranet and Internet-based "smart agent" software.

Terms of the agreement were not disclosed.

CYBER VISTA, creator of unique Information Task Management (ITM) software, will begin immediately to develop its "Data Grabber task agents" for custom use in SIU's business and consumer product applications. Specific products and release dates will be provided in the future.

According to Sreenath Pendyala, vice president and general manager of SIU, the primary focus of the agreement is on "Data Grabber" technology that allows intranet and Internet users to request and get immediate access to online information.

"Seiko Instruments wants to provide customers with Internet-ready products to enhance productivity," Pendyala said. "This joint development project will result in unique technology that will benefit all PC users."

"Seiko Instruments is an ideal partner because of its markets, and adaptability of our task agents," said Daniel Ashby, CYBER VISTA president. "This project will make the power and control of Data Grabber quickly available to consumers and members of the business community."

He added that "webcasting" and "push" technologies provide customized information, but do not deal with source environment, format and destination environment issues. "CYBER VISTA's Internet/intranet Information Task Management (ITM) software addresses all of these issues, runs unattended and is customized to each application."

The technology involves "find" and "deliver" segments. The "find" side can locate, collect, extract and analyze information as specified by the user. The "deliver" capabilities include processing, reformatting and providing the information in the format or environment the user requested.

CYBER VISTA, based in San Mateo, Calif., produces and markets powerful, easy-to-use management software to find, monitor, compare, analyze, retrieve, reformat and distribute user-specified online information. In addition to retrieving ("grabbing") data, the company's software makes that information useable and delivers it automatically.

The ITM core technology adapts reusable components and engines for client/server applications to create scaleable information processing and distribution solutions. Phone: 415/372-0800. Web site: <http://www.cybervista.com> .

Seiko Instruments USA, a privately held U.S. corporation, is the Western Hemisphere marketing and sales affiliate of Seiko Instruments Inc., one of three worldwide Seiko group companies. With the focus on providing "big technology in small packages," SIU products include electronic components, micro thermal printers, factory automation robotics systems, color printers and supplies, consumer electronic products, digital imaging and compact convenient peripherals for the office and home/office personal computer market.

SIU has headquarters at 1130 Ringwood Court, San Jose, Calif. 95131. Telephone: 408/922-5900, Fax: 408/433-3261, Web site: <http://www.seikosmart.com> . -0-

**CYBER VISTA: CYBER VISTA Offers Free Download of New Data Grabber Lite,
Leading-Edge Software for Information Task Management**

November 17, 1997

Byline: Business Editors/Computer Writers
Dateline: SAN MATEO, Calif.
Time: 03:00 PT
Word Count: 494

See CYBER VISTA at Microsoft's COMDEX Pavilion

SAN MATEO, Calif.--(BUSINESS WIRE)--Nov. 17, 1997--
Unattended 'Task Agents' Monitor Web Sites, Track Stocks,
Find Lowest Air Fares, or Demo Windows APIs,
Then Automatically Notify User or Take 'Scripted' Action
CYBER VISTA, San Mateo-based developer of Intra/Internet
Information Task Management (ITM) software used by major
organizations including the U.S. government, Seiko Instruments
America (SIU), The Sabre Group and TCI, will demonstrate a new "Lite"
version at COMDEX available immediately as a free download from the
company's Internet home page (www.cybervista.com).

"Data Grabber Player Lite includes four customized "task
agents" and a demonstration, so individuals can learn and apply
useful internet applications immediately and at no cost," said
Daniel Ashby, CYBER VISTA president. "Although our current focus is
major corporate applications, end users need this introduction to ITM
technology, since we plan to sell more robust upgraded versions on
the Internet for \$99 from January 1 throughout the first quarter of
1998."

DG Player Lite will let users try regular Data Grabber
functionality in at least four useful and proven applications. All
task agents allow users to make individual choices, and run
unattended. They can:

- Retrieve and present lowest air fare at user-specified date and
time;
- Monitor any web site for changes;
- Monitor web site for unauthorized changes, then automatically
alert user and restore site;
- Track any five selected stocks, then alert user to major changes
on desktop; and
- Demonstrate Windows APIs for technical users.

All of these "Lite" applications are already user proven by
individuals and corporations, including Seiko Instruments America,
TCI and Sabre Group's Travelocity.

"This free product is the first widely-available answer to cries
from industry editors and analysts for a way to make the mushrooming
volume of information or 'knowledge' both accessible and useful,"
said Nick Roche, CYBER VISTA vice president, sales and marketing.
"Earliest applications, and some soon to be announced do just that --
they make on-line information manageable."

About CYBER VISTA:

CYBER VISTA, based in San Mateo, Calif., produces and markets
powerful, easy-to-use management software to find, monitor, compare,
analyze, retrieve, reformat and distribute user-specified on-line
information. In addition to retrieving ("grabbing") data, this
software makes that information useable, and delivers it
automatically in a wide range of environments (cell phone, beeper,
e-mail, desktop, etc.).

The ITM core technology adapts reusable components and engines for client/server applications to create scaleable information processing and distribution solutions. It has both "find" and "deliver" segments. The "find" side locates, collects, extracts and analyzes user specified information. "Deliver" includes processing and "repurposing" data. Phone: (415) 372-0800. Website: <http://www.cybervista.com>.

**TCI INTESSERA: TCI Intessera Division to Use CYBER VISTA Data Grabber
Maximizer for Website Information Security Management; Customized
System 'Task Agents' Alert Webmasters to Attempted Intrusion**

September 15, 1997

Byline: Business Editors & High Tech Writers
Dateline: SAN MATEO, Calif.
Time: 17:15 PT
Word Count: 314

SAN MATEO, Calif.--(BUSINESS WIRE)--Sept. 15, 1997--CYBER VISTA, a San Mateo-based developer of Information Management Technology (ITM) software solutions, announced TCI's Intessera Division as a major customer for CYBER VISTA's Data Grabber Maximizer System.

Intessera provides customized computer applications for government and corporate clients worldwide.

Intessera will customize web "sentinels" to inform webmasters of attempted intrusions or changes and to archive web history with CYBER VISTA task agents. "Initially, we are targeting government customers. We'll leverage that activity beyond government into selected vertical industries," said Eric Kemp, manager and systems administrator for Intessera's technology group

"Data Grabber can detect virtually any change to a website, including text, HTML, graphics and more. Other packages we've tried just can't do that," he said. "The Data Grabber Maximizer System is a wonderful application development environment robust enough to meet every customer need."

Daniel Ashby, co-founder and president of CYBER VISTA, said, "Intessera has demonstrated a forward thinking application of Data Grabber Maximizer technology, which can continuously monitor all or part of a web site for unauthorized changes, and 'report' automatically."

CYBER VISTA, based in San Mateo, produces and markets powerful, easy-to-use on-line information management software to find, monitor, compare, analyze, retrieve, reformat, and distribute on-line information as specified by the user. Years of research and development have resulted in CYBER VISTA's unique Intra/Internet Information Task Management (ITM) technology -- a powerful and easy to use solution for on-line information management.

CYBER VISTA's core technologies include reusable components and engines for client/server applications, providing scaleable solutions for information processing and distribution.
